

set lower_bound() function in C++ STL

Difficulty Level : Easy • Last Updated : 21 Oct, 2020

The **set::lower_bound()** is a built-in function in C++ STL which returns an iterator pointing to the element in the container which is equivalent to *k* passed in the parameter. In case *k* is not present in the set container, the function returns an iterator pointing to the immediate next element which is just greater than *k*. If the key passed in the parameter exceeds the maximum value in the container, then the iterator returned points to the element beyond last element in the set container that is `set.end()`.

Syntax:

```
set_name.lower_bound(key)
```

Parameters: This function accepts a single mandatory parameter *key* which specifies the element whose `lower_bound` is to be returned.

Return Value: The function returns an iterator pointing to the element in the container which is equivalent to *k* passed in the parameter. In case *k* is not present in the set container, the function returns an iterator pointing to the immediate next element which is just greater than *k*. If the key passed in the parameter exceeds the maximum value in the container, then the iterator returned is equivalent to `s.end()` (A special iterator points beyond the last element).

Below program illustrate the above function:

C++

```
// C++ program to demonstrate the
// set::lower_bound() function
#include <bits/stdc++.h>
using namespace std;
```

```

// Function to insert elements
// in the set container
s.insert(1);
s.insert(4);
s.insert(2);
s.insert(5);
s.insert(6);

cout << "The set elements are: ";
for (auto it = s.begin(); it != s.end(); it++)
    cout << *it << " ";

// when 2 is present
auto it = s.lower_bound(2);
if (it != s.end()) {
    cout << "\nThe lower bound of key 2 is ";
    cout << (*it) << endl;
}
else
    cout << "The element entered is larger than the "
           "greatest element in the set"
           << endl;

// when 3 is not present
// points to next greater after 3
it = s.lower_bound(3);
if (it != s.end()) {
    cout << "The lower bound of key 3 is ";
    cout << (*it) << endl;
}
else
    cout << "The element entered is larger than the "
           "greatest element in the set"
           << endl;

// when 8 exceeds the max element in set
it = s.lower_bound(8);
if (it != s.end()) {
    cout << "The lower bound of key 8 is ";
    cout << (*it) << endl;
}
else
    cout << "The element is larger than the greatest "
           "element in the set"
           << endl;

return 0;
}

```

Output:

Got It !

The element is larger than the greatest element in the set
